| Modifiers of the temperature and mortality association in seven US cities                                | 1   | 2003           | United States                             | United States                          | [Marie S. O'Neill; Antonella Zanobetti; Joel Schwartz] Environmental Epidemiology Program, Department of Environmental Health, Harvard School of Public Health, Boston, MA 02115 USA;[Joel Schwartz] Department of Epidemiology, Harvard School of Public Health, Boston, MA 02115 USA | 66          | AMERICAN JOURNAL OF EPIDEMIOLOGY                                     | 1986                          | 1993                        | 7                     | Not clear           | Deaths among Blacks compared with Whites, deaths among the less educated, and deaths outside a hospital were more strongly associated with hot and cold temperatures, but gender made no difference. Stronger cold associations were found for those less than age 65 years, but heat effects did not vary by age. The strongest effect modifier was place of death for heat, with out-of-hospital effects more than five times greater than in-hospital deaths, supporting the biologic plausibility of the associations. Place of death, race, and educational attainment indicate vulnerability to temperature-related mortality, reflecting inequities in health impacts related to climate change. | People with low SES, People of color and indigous people and migrants                          | Poisson regression | Quantitative methods | Heat, Cold Spell       | North America | City or sub-national |
| Disparities by race in heat-related mortality in four US cities: The role of air conditioning prevalence | 2   | 2005           | United States                             | United States                          | [Marie S. O'Neill] Univ Michigan, Ctr Social Epidemiol & Populat Hlth, Robert Wood Johnson Hlth & Soc Scholars Program, Ann Arbor, MI 48104 USA;[Antonella Zanobetti; Joel Schwartz] Harvard Univ, Sch Publ Hlth, Dept Environm Hlth, Boston, MA 02115                                 | 8           | JOURNAL OF URBAN HEALTH-BULLETIN OF THE NEW YORK ACADEMY OF MEDICINE | 1986                          | 1993                        | 7                     | Adaptive capability | Revalence of central air conditioning (AC) among Black households was less than half that among White households in all four cities, and deaths among Blacks were more strongly associated with hot temperatures. Central AC prevalence explained some of the differences in heat effects by race, but room-unit AC did not.  | People of color and indigous people and migrants, People with disadvantaged housing conditions | Poisson regression | Quantitative methods | Heat                   | North America | City or sub-national |

| Spatial analysis of hospital admissions for respiratory diseases during summer months in Berlin taking bioclimatic and socio-economic aspects into account | 7 | 2013 | Germany       | Germany       | [Scherber, Katharina; Langner, Marcel; Endlicher, Wilfried] Humboldt Univ, Dept Geog, D-10099 Berlin, Germany   | 6   | ERDE                              | 2000 | 2009 | 9  | Exposure            | High building density and a lack of urban green and water spaces determine the adverse bioclimatic evaluation of urban environments. The resulting heat stress causes impacts on health, especially on respiratory illness. The relative risks for hospital admissions among > 64yearolds with RD during the summer months in Berlin based on the number of cases from 2000 to 2009 indicated significant clusters of increased risk in the northwestern and southeastern city centre. These areas are characterised by high population densities, densely builtup areas with a high annual mean number of days with heat load based on the period 19712000 and the average of the periods 19712000 and 20212050 and adverse socioeconomic conditions. | People in urban areas                       | Spatial epidemiological approach                        | Quantitative methods | Heat | Europe | City or sub-national |

| Economic Burden of Hospitalizations for Heat-Related Illnesses in the United States, 2001-2010 | 19 | 2016 | United States | United States                 | [Schmeltz, Michael T.] US EPA, ASPPH EPA Environm Hlth Fellowship Program, Off Res & Dev, Natl Ctr Environm Assessment, Washington, DC 20001 USA; [Petkova, Elisaveta P.] Columbia Univ, Earth Inst, Natl Ctr Disaster Preparedness, New York, NY 10027 USA; [Gamble, Janet L.] US EPA, Off Res & Dev, Natl Ctr Environm Assessment, Washington, DC 20460 USA | 8 | INTERNATIONAL JOURNAL OF ENVIRONMENTAL RESEARCH AND PUBLIC HEALTH | 2001 | 2010 | 9 | Exposure, Inherent sensitivity, Adaptive capability | Costs of heat-related illness (HRI) hospitalizations were higher among racial/ethnic minorities compared to Whites. Observed differences in costs based on income, insurance, and gender were also significant. These results suggest that these populations are suffering disproportionately from health inequity, thus, they could shoulder greater disease and among HRIs, females have fewer hospitalizations but bear a greater burden of the hospitalization costs. Males may be more likely to have occupations that are outdoors, performing physical activity in high temperature environments, increasing their exposure. These males may be in generally good health (healthy worker effect) and may only suffer from minor heat-related illnesses, not incurring high healthcare costs. For females, we considered pregnancy as a potential cause for the increased costs among this population, adults aged 40–64 years old have a larger percentage of HRI hospitalizations during this time period, though older adults aged 65+ years old had significantly higher costs for HRI hospitalizations. Older adults were also more likely to be covered under Medicare. | Females, People of color and indigenous people and migrants | Log-gamma model with patient and hospital characteristics                       | Quantitative methods | Heat  | North America | National             |

| Adaptation outcomes in climate-vulnerable locations: understanding how short-term climate actions exacerbated existing gender inequities in coastal Bangladesh | 57 | 2022 | United States | United States    | [Ahmed, Saleh] Boise State Univ, Sch Publ Serv, Boise, ID 83725 USA; [Eklund, Elizabeth] Univ Arizona, Sch Anthropol, Tucson, AZ USA; [Kiester, Elizabeth] Albright Coll, Sociol, Reading, PA 19612 USA | 0  | JOURNAL OF ENVIRONMENTAL PLANNING AND MANAGEMENT            | 2015 | 2018 | 3 | Adaptive capability                       | Agricultural institutions have traditionally and historically linked with gender roles. Outmigration from the region is gendered as males leave first. This forces increased household and farm responsibilities onto female household members and increased vulnerability. This gendered vulnerability becomes compounded by the ways critical weather information flows at the local level.   | Females  | Participant observation, Focus Group Discussions (FGDs), key informant interviews | Qualitative methods  | Rising Sea Levels and Extreme Rainfalls, Food-borne Diseases and Malnutrition | Africa        | City or sub-national |

| How food-system resilience is undermined by the weather: the case of the Rama Indigenous group, Nicaragua   | 61 | 2022 | United Kingdom | United Kingdom | [Papworth, Andrew J.] Univ York, Dept Hlth Sci, York, England; [Maslin, Mark; Randalls, Samuel] Univ Coll London UCL, Dept Geog, London, England  | 18 | ECOLOGY AND SOCIETY | 2015 | 2016 | 1 | Adaptive capability | There are different levels of food system resilience between the Rama who fish using the traditional methods of hand nets and paddle-powered canoes, and those that can afford gill nets and motorboats. Secondly, there are significant differences in the way Rama farmers respond to threats to their food security: some rely on short-term resilience-based strategies, whereas others focus on more transitional responses. These differences contribute to short-term inequalities in food security and are also likely to have a differential impact on the future food-system resilience of the Rama community. | People with low SES, Vulnerable industries | Explanatory sequential mixed-methods approach: household survey and interviews | Mixed methods        | Food-borne Diseases and Malnutrition | North America | City or sub-national |
