Introduction

- An adaptive filter based on reference signals from an electrooculogram (EOG) can reduce ocular interference, but collecting EOG signals during a long-term EEG recording is inconvenient and uncomfortable.
- To remove ocular artifacts from EEG in brain-computer interfaces (BCIs), a method named spatial constraint independent component analysis based recursive least squares (SCICA-RLS) is proposed.
- The proposed method avoids the need for parallel EOG recordings. In addition, it has the ability of fast computation.

Conclusions

- A new method, SCICA-RLS, for automatically removing ocular artifacts in EEG data is presented.
- The method eliminates the embarrassment of collecting EOG data during a long-term EEG recording.
- The proposed method can remove artifacts clearly and achieve high classification accuracy.
- Meanwhile, the proposed method is much faster than the ICA and ICA-RLS methods, which can provide a foundation for online and practical applications.
