**Figure S1.** a) SEM image showing four distinct morphologies of the sample. b) Pure nanoplate of hexagonal shape. c) Nanoplate of trapezoidal shape. d) Single crystals of various shapes. e) Composite of nanorods and nanoplates.

**Figure S2.** TEM (a-b) and SEM (c-d) images of the composite heterojunctional materials at different magnifications.

**Figure S3.** The HAADF image of the composite material and the corresponding quantitative chemical analysis using EDS. Region 1 and region 2 correspond to nanoplate/nanorod composite and pure nanorod, respectively.

**Figure S4.** a) The atomic resolution HAADF image of pure nanorod region in the composite materials. b) Magnified image of the red dotted box region in (a), which is projected along [001] axis. The bottom left inset is the atomic model of  $Sb_2S_3$  with [001] projection. The atomic model is overlapped on top of the right-hand side of the HAADF image, where the bright spots coincide with the Sb atomic columns.

**Figure S5.** The atomic resolution HAADF image of  $Sb_2S_3$  nanorod/ Sb nanoplate hetero-interface. While  $Sb_2S_3$  is perfectly projected along its [001] axis, Sb is slight tilted off its [010] axis.
