Supplementary Figure 1

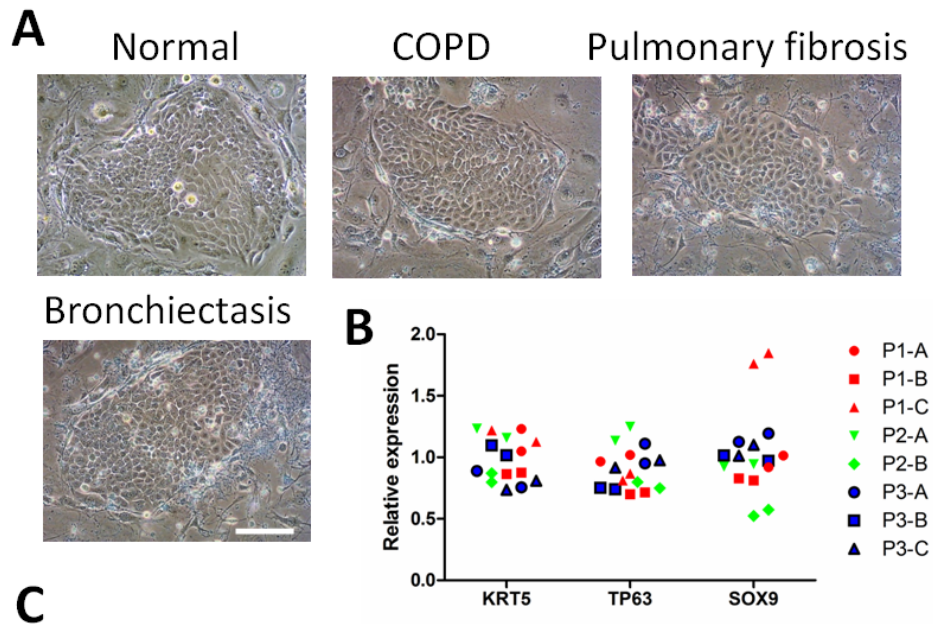

Supplementary Figure 1. Characterization of clonogenic BCs. A, Anti-HuNu, anti-human Lamin A+C, anti-NKX2.1, anti-Ki67 and anti-E-Cadherin immunostaining of KRT5⁺/P63⁺ BC clones. **B,** Immunostaining of BC clones with indicated antibodies and nuclei counterstain. Anti-P63 or anti-KRT5 immunostaining was used to indicate the identity of BC clones. Scale bars, 100 μm.

Supplementary Figure 2.

Supplementary Figure 2. SOX9+ BCs in human lung . SOX9⁺ BCs in crypt of 2nd order human airway by anti-SOX9 and anti-P63 immunostaining. Scale bar, 100 μ m.

Supplementary Figure 3.

C

Disease Categories	Clone name	Passage 1 (number of clones)	Passage2 (number of clones)
1 (normal)	1-A	152	10,496
	1-B	110	5,796
	1-C	308	22,008
	1-D	118	4,488
	1-E	74	5,416
2 (pulmonary fibrosis)	2-A	188	7,152
	2-B	162	9,784
	2-C	46	3,560
3 (bronchiectasis)	3-A	80	3,668
	3-B	104	5,760
4 (COPD)	4-A	26	89
	4-B	8	200

Supplementary Figure 3. Clonal analysis of SOX9⁺ BCs. **A.** SOX9⁺ BC clones isolated from persons of different lung disease background. **B.** Diagram showing the relative gene expression of distinct single cell-derived clones. P1, P2 and P3 indicated three individual persons. **C.** Table showing the growth rate of different single cell-derived clones from 4 individual persons.

Supplementary Figure 4.

Supplementary Figure 4. Characterization of clonogenic basal cells. A. Diagram showing distinct anatomic locations of isolated tracheal basal cell (TBC) and SOX9⁺ BC by bronchoscopic brushing. **B.** TBC colonies grown on feeder cells; right, anti-KRT5 and anti-P63 immunostaining of TBC colonies with nuclei counterstain. Scale bar, 100 μ m.

Supplementary Figure 5.

Supplementary Figure 5. Chronic lung injury model for transplantation. A, MicroCT imaging of normal (left) and bleomycin injured (right) mouse lung. Arrowheads indicate lung tissue damage. **B,** Immunostaining of mouse lung after indicated days of bleomycin administration showing loss of lung epithelium marker (PDPN and SPC) and gain of fibrosis marker (α -SMA). **C,** MT (masson trichrome) staining images of mouse lung injured by bleomycin showing large-scale lung fibrosis (30 days post administration). **D,** Anti-Krt5 and anti-p63 immunostaining of mouse lung injured by bleomycin (30 days post administration). Scale bar, 100 μ m.

Supplementary Figure 6.

A

Ct value	Mouse	Human	Chimera
Human specific GAPDH	35.2 ± 3.1	14.8 ± 0.2	24.4 ± 0.1

Cervical SOX9+ BCs

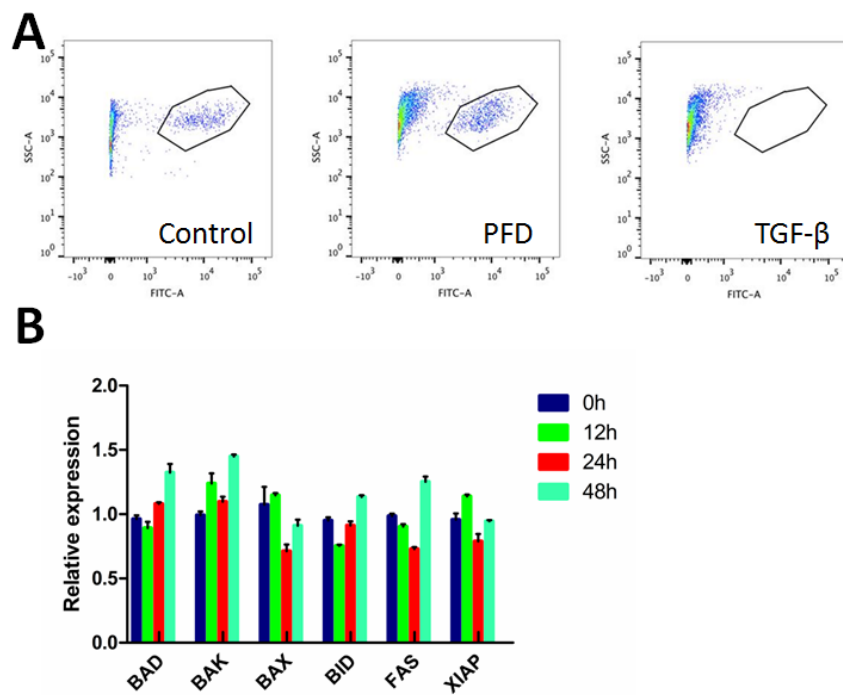

Supplementary Figure 6. Transplantation of human SOX9⁺ BCs into mice generates chimeric lung. **A.** Normalized Ct values of qPCR reaction with indicated human-specific GAPDH primer pairs. In the sample of mouse lung, both high Ct and abnormal melt curve was observed for GAPDH. n=3, biological replicates. **B-D.** Immunofluorescent images showing regenerated ciliated cells (Acetylated-Tubulin+, FOXJ1+) and Club cells (CC10+) by SOX9+ BC transplantation. Scale bar: 10 μ m. **E.** Clonogenic BCs isolated from human cervix epithelium obtained by biopsy, characterized by immunostaining and labeled by GFP.

Supplementary Figure 7.

Supplementary Figure 7. Functional epithelium-vasculature interaction in regenerated lung. **A**, Photo-cleared mouse lung after GFP⁺SOX9⁺ BCs transplantation was subjected to direct fluorescence imaging (left) and blood vessel visualization (right, asterisks) in the same region under stereomicroscope. **B**, Bright-field imaging of intravenously (I.V.) delivered AuNP (brown) of normal or injured region of mouse lung. Rare signal detected in injured region indicated deficiency of blood-gas exchange function. **C**, Bright-field imaging of intratracheally (I.T.) delivered AuNP (brown) of normal or injured region of mouse lung. Rare signal detected in injured region indicated deficiency of inhale function. Scale bar, 100 μ m.

Supplementary Figure 8.

Supplementary Figure 8. TGF- β modulates SOX9⁺ BC proliferation. **A**, Representative flow cytometry analysis of GFP⁺ cells in SOX9⁺ BC transplanted mouse lung with Pirfenidone or TGF- β treatment, respectively. **B**, qPCR showing apoptosis-related gene expression level of SOX9⁺ BCs with 10 ng/ml TGF- β treatment for indicated hours. n=3, biological replicates. Error bars, S.E.M. n.s, not significance.
