

## **Materials and methods**

### **Patients**

All participating patients were diagnosed with bladder cancer, among which were 48 high grade and 12 low grade. Seven healthy volunteers were chosen as a control group. Urine and tumor samples were collected before clinical chemo-therapeutic treatment. Our study has been approved by Zhongshan Hospital Ethics Committee (project number: B2016-148 and B2017-129R). All experimental protocols were carried out in accordance with the guidelines approved by the Zhongshan Hospital Ethics Committee. Informed consent was obtained from all of the patients in this study.

### **Urine and tissue processing**

Urine samples of each patient were collected from clean, mid-stream urine before treatment. 50 ml of urine was collected in sterile tubes with penicillin/streptomycin mix (final concentration: 200U/mL penicillin and 200 $\mu$ g/mL streptomycin) and centrifuged at 1000 rpm for 10 min. The supernatant was aspirated, and the pellet was washed with PBS for three times before added into culture plates.

Bladder tumor tissues were collected from patients undergoing transurethral resection or cystoscopy and then transferred into a 15 ml tube with sterilized PBS. All samples were packaged on ice and the following steps were conducted in sterile conditions within 6 h. Tissues were minced with scalpels into small pieces, and parts of the tissues were saved for genomic DNA extraction and others were digested with

digestion buffer composed of dispase (Gibco), collagenase (Sigma) and hyaluronidase (Sigma). After dissociation, the cells were centrifuged at 1000 rpm for 5 min and the supernatant was discarded. Cell pellets were re-suspended in medium and transferred into plates for culturing.

### **Establishment of urine and tumor CRCs**

For preparation of complete F medium, we mixed 373 ml of DMEM (Gibco) and 125 ml of F12 nutrient (Gibco) and added the following additions with final concentrations of 5 µg/ml insulin (Sigma-Aldrich), 0.125 ng/ml EGF (Sangon) and 25 ng/ml hydrocortisone (Sigma-Aldrich). The solution was filtered with a 0.2-µm sterile filter and stored at 4°C for up to 2 weeks after adding the ROCK inhibitor Y-27632 (DC Chemicals) at a final concentration of 10 µM. NIH-3T3 cells were irradiated at a dose of 50 Gy as feeder cells. Cell pellets derived from urine and tumor samples were transferred into a 6 cm dish with feeder cells at a confluence of  $1 \times 10^4$  cells/cm<sup>2</sup> in complete F medium. Formation of visible CRC colonies was monitored after 24-72 hours seeding. CRCs were differentially trypsinized to separate from feeder cells and passaged when reached 80% to 90% confluence using a 1:3 dilution and were given fresh medium every 2 to 3 days.

### **3D cell culture**

The established CRCs were differentially trypsinized to be separated from feeder cells and counted using Cell Counter (Invitrogen). They were subsequently seeded onto round-bottomed non-tissue culture treated 96-well plates (Thermo) at a concentration

of 2500 cells/well in 100  $\mu$ L DMEM-F12 (Gibco), supplemented with 20% methyl cellulose stock solution and 10% FBS (Gibco). Spheroids were grown under standard culture conditions (5% CO<sub>2</sub>, at 37°C) and formed 3D cultures within 24 hours.

### **HE staining and immunohistochemistry**

CRCs and tissues were fixed with 10% neutral buffered formalin, embedded in paraffin, and cut into 4  $\mu$ m sections. The sections were stained with hematoxylin and eosin (H&E) following standard protocols. For immunohistochemistry, the sections were de-paraffinized, rehydrated and antigens were retrieved by heating the slides in 0.01 M sodium citrate (pH 6.0). The following antibodies were used: GATA3 (Gene Tech), P40 (DAKO), and P63 (MXB). Antibodies were visualized using 3,3'-diaminobenzidine (DAB) chromogen, counterstained with hematoxylin and mounted with DPX (Sigma-Aldrich).

### **Transwell assays**

$2 \times 10^4$  CRCs were seeded on the top chamber of an 8  $\mu$ m 24 mm polycarbonate Transwell ® insert (Costar) in serum-free complete F medium while the bottom chamber contained complete F 20% FBS following an adapted protocol. The cells were allowed to migrate for 48 hours. The cells attached to the top of the membrane were removed using aseptic cotton carriers and rinsed with PBS. Lastly, the bottom of the membrane was fixed with 95% alcohol, stained with 0.1% crystal violet, and imaged by microscope (OLYMPUS).

### **Whole exome sequencing (WES)**

Genomic DNA was extracted from parental tissues and urine and tumor CRCs using the TIANamp Genomic DNA Kit (TIANGEN). The exomes were captured using SeqCap EZ MedExome Target Enrichment Kit. Captured DNA fragments were sequenced on an Illumina Novaseq as paired-end 150-bp reads. Reads were aligned to the hg19 version of the human genome using Burrows-Wheeler Aligner software (BWA, version 0.5.9). PCR duplicates were marked using the MarkDuplicates tool in Picard. IndelRealigner and BaseRecalibrator in the Genome Analysis Toolkit (GATK; version 3.8) were used to realign and recalibrate the BWA alignment results. VarScan was used for identifying paired-sample variant calling of SNVs and indels on tumor and matched normal samples. All variants were annotated using Annovar.

To ensure the quality of data, the following criteria were performed to filter raw variant results: average effective sequencing depth on target per sample  $\geq 200x$ ; allele mutation frequency  $\geq 5\%$  and  $\geq 10\%$  for single nucleotide variation and insertion or deletion, respectively; all reads were filtered by high mapping quality ( $\geq 30$ ) and base quality ( $\geq 30$ ); and the mutant reads must be supported by positive and negative strands.

### **hTERT mutation analysis**

Genomic DNA of urine CRCs, tumor CRCs, tumor tissues and blood was extracted by TIANamp Genomic DNA Kit following the manufacturer's instructions (TIANGEN). Primers for mutant hTERT promoter C124T and C146T were

synthesized as 5'-CACCCGTCCTGCCCCTTCACCTT-3' and 5'-GGCTTCCCACGTGCGCAGCAGGA-3', respectively (Sangon). These two primers were used to amplify target DNA in 50  $\mu$ L PCR reactions in 1X high-fidelity hot start DNA polymerase (Biotool) containing 200 ng template. After incubation at 95°C for 180 seconds, 34 cycles of PCR were performed in the following manner: 95°C for 30 seconds, 60°C for 30 seconds, and 72°C for 30 seconds, and then the final elongation at 72°C for 5 min. The purified PCR products were sequenced by Sangon Company (Songjiang District, Shanghai, China) and analyzed using Snapgene software.

### **STR analysis**

Total DNA was isolated from urine CRCs, tumor CRCs, tumor tissues, and germline control blood cells using the TIANamp Genomic DNA Kit (TIANGEN). The following STR markers were tested: D8S1179, D21S11, D7S820, CSF1PO, D3S1358, D5S818, D13S317, D16S539, D2S1338, vWA, D12S391, D18S51, Amelogenin, D6S1043, and FGA. Detection of the amplified fragments was performed using the ABI 3100 genetic analyzer (Applied Biosystems). Data analysis were achieved with GeneMapper Software (Applied Biosystems).

### **Drug sensitivity testing**

CRCs derived from urine and bladder tumor tissues were used for the drug response test with 64 clinical oncology drugs, containing chemotherapy drugs and targeted drugs. All drugs were bought from DC Chemicals (Jung-gu, Seoul, Korea) and

Selleck (Houston, Texas, USA). Briefly, cells were plated in 384-well microtiter plates at 400 cells per well in 50  $\mu$ L conditional medium, and 12 h later, after cell adherence, they were exposed to drugs with series different concentrations for 72 hours. The CRCs' viability was measured with CellTiterGlo (Promega) by Envision plate reader from PerkinElmer.

### **Statistical analysis**

A sigmoidal concentration-response curve was fitted with GraphPad Prism 7 software and half-maximal inhibitory concentration ( $IC_{50}$ ) was calculated. Drug sensitivity scores (DSS) were calculated by the ratio of each sample to 5637, then applying a log 10 scale. The clustered heatmaps (v. 1.0.10) were then generated by R package pheatmap (v.3.5.1, <http://www.r-project.org/>).

**Supplementary Figure S1. Success rate of urine CRCs.**

The similar high success rate indicating that CRCs can be established without the bias from all bladder cancer patients.

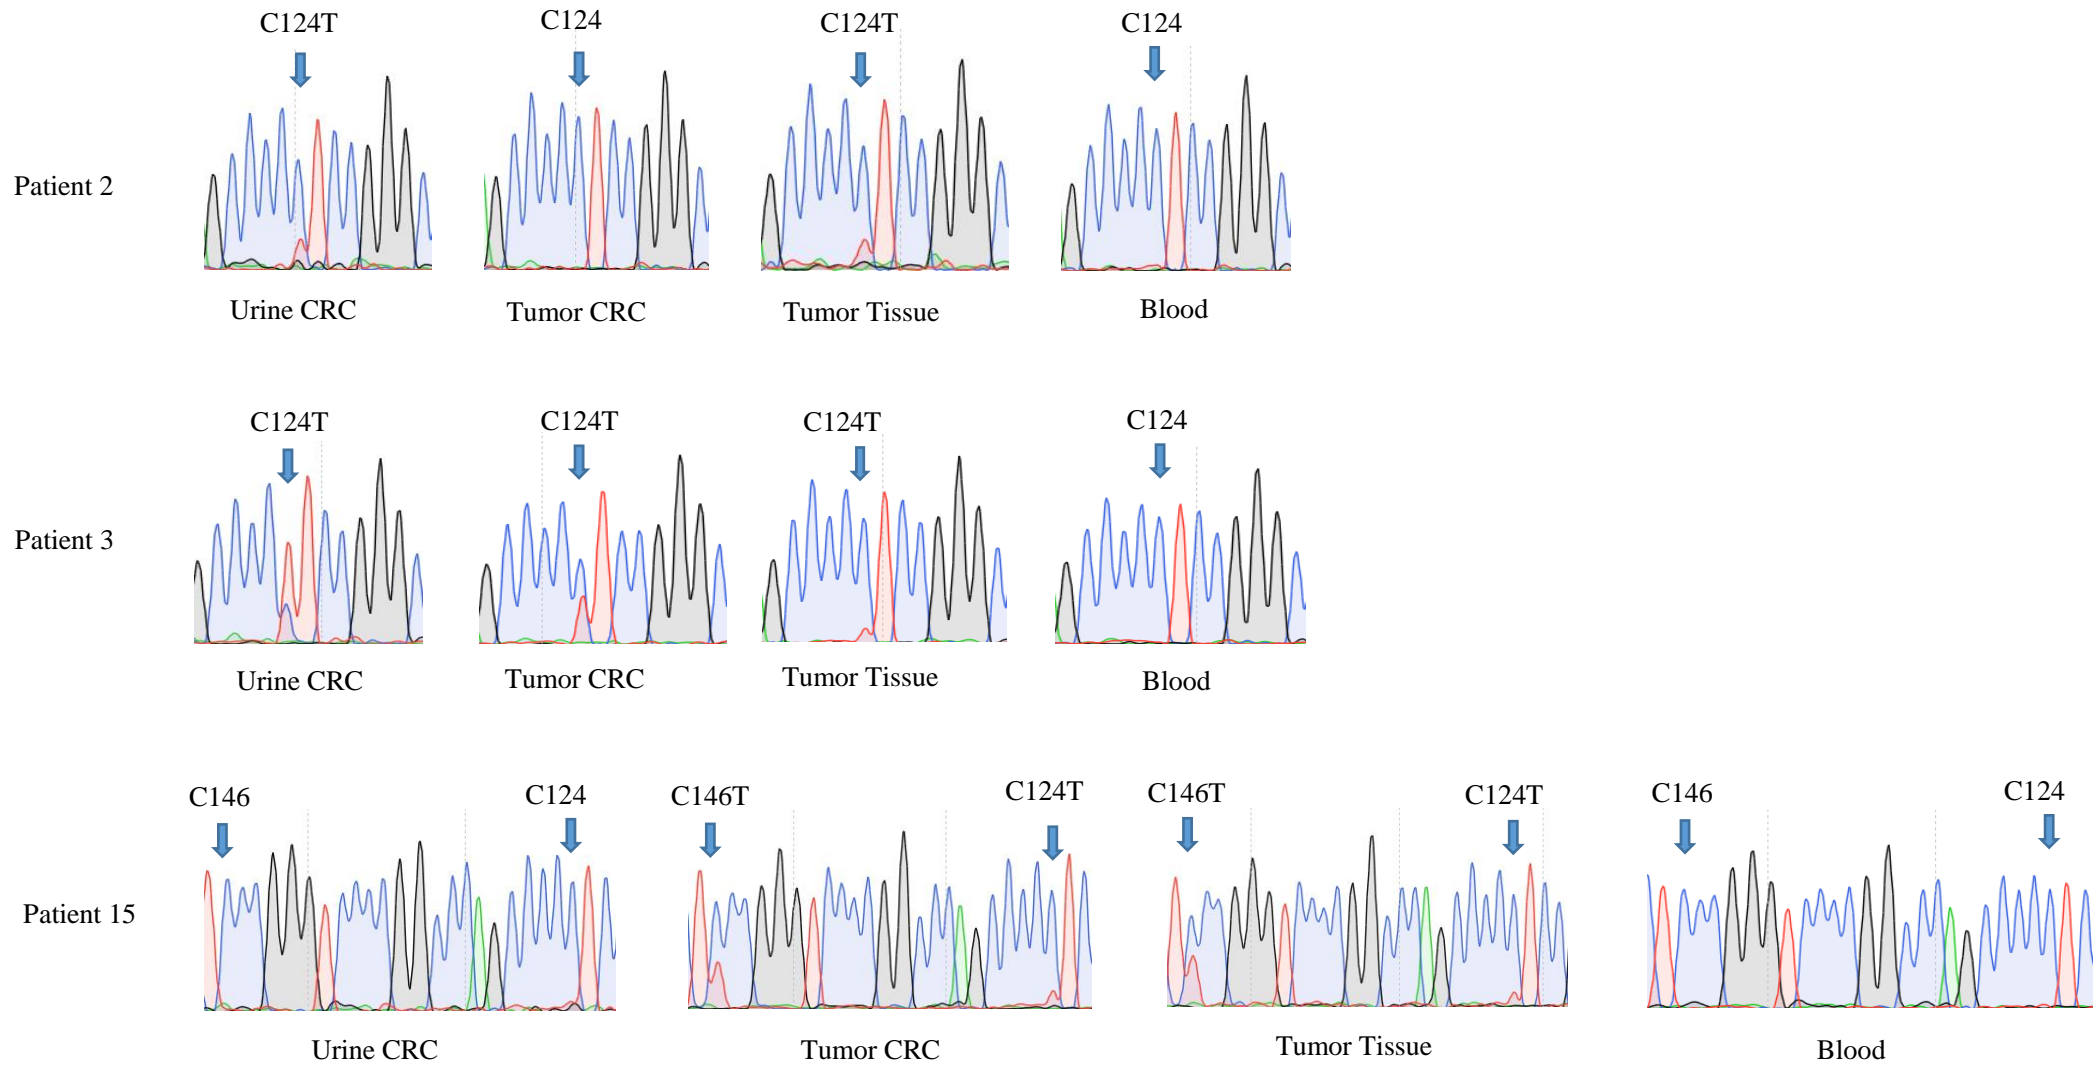

**Supplementary Figure S2. Characterization of urine and tumor CRCs.**

(A) The light microscope images of 2D and 3D culture of urine and tumor CRCs. The established urine and tumor CRCs all rapidly formed cell colonies and have the ability of spheroid formation (representative image of >40 independent CRCs). The scale bars indicate 500  $\mu\text{m}$ . (B) Representative HE staining of urine and tumor CRCs from patient 1, 2 and 3 and corresponding tumor tissues, used for determining the tumor status and histological origin (representative image of at least  $n = 3$  independent). The scale bars indicate 50  $\mu\text{m}$  (CRCs) and 200  $\mu\text{m}$  (tissues).

**Supplementary Figure S3. Transwell assays of urine CRCs.**

Transwell assays of several urine CRCs shows difference of the invasion ability from different patient origin (n = 3 independent experiments). The scale bars indicate 200  $\mu$ m.

**Supplementary Figure S4. Somatic hTERT promoter mutation in bladder cancer tissue, CRCs and blood.**

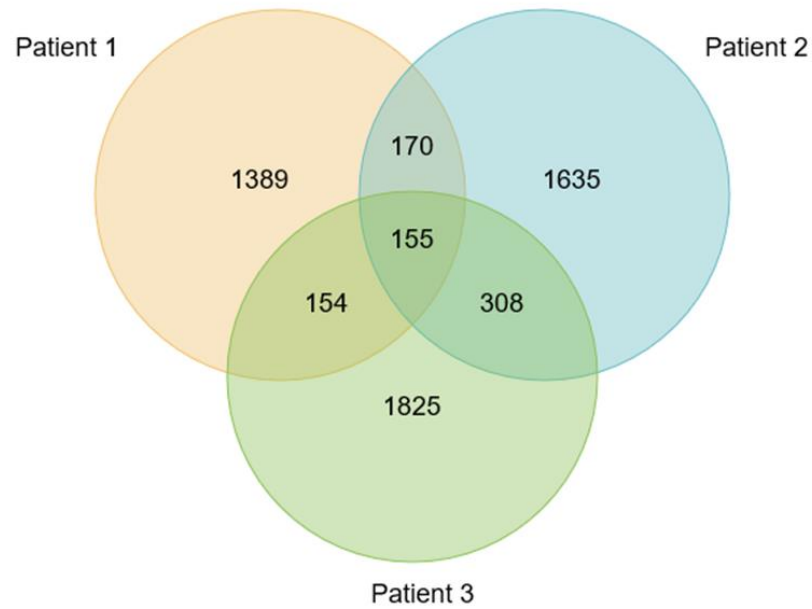

The C124T and C146T mutations are detected in tumor tissues, urine CRCs and tumor CRCs but not in blood samples. hTERT = human telomerase reverse transcriptase.

**Supplementary Figure S5. Exome sequence in urine and tumor CRCs.**

Landscape of common somatic mutations among paired urine CRCs, tumor CRCs and tumor tissues for the same patient. Samples are arranged in columns, genes are arranged in rows. Mutation types are displayed by different colors in the bottom panel.

## SNVs

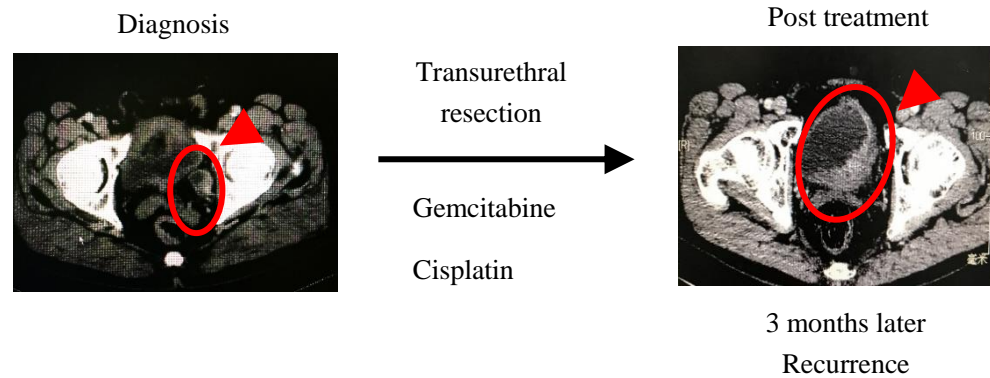

## Indels

**Supplementary Figure S6. SNVs and Indels in tumor tissues of Patient 1, 2, 3.**

Venn diagram of SNVs and Indels in formalin-fixed paraffin-embedded samples of patient 1, 2 and 3. Mutation numbers are showed within the circles.

**Supplementary Figure S7. Drug sensitivity and corresponding clinical relevance of urine CRC from patient 21.**

Urine CRC's dose-response curves for the indicated drugs are exhibited in the upper row, and the CT of the patient before and after treatment are shown in the lower row. Urine CRCs isolated from patient 21 showed resistance to gemcitabine and low sensitivity to cisplatin, which is closely related to the prognosis of patient 21 who accepted tumor resection followed chemotherapy but relapse soon. Red circles and arrows indicate primary or recurrence tumors.

**Supplementary Table S1. Patient characteristics and corresponding conditionally reprogrammed cells (CRC)**

	Male/ Female	Age	primary/ recurrence	pathology	TNM	NMIBC/ MIBC	Tumor number	Risk group	treatment	Tumor CRC	Mutation of hTERT promoter	Urine CRC	Mutation of hTERT promoter

60 patients were enrolled and been classified by gender, age, pathology, tumor number, TNM and risk group. Pathology: H=high grade, L=low grade; MIBC=Muscle-invasive bladder cancer, NMIBC=Non-muscle-invasive bladder cancer, UTUC= Upper tract urothelial carcinoma; Tumor number: s=single, m=multiple; Risk group: H=high risk, L=low risk; Treatment: TURBT=transurethral resection of bladder tumor, PC=partial cystectomy, RC=radical cystectomy. Tumor/urine CRC: 1=successfully established, 0= fail to establish, - = No sample, ND = No detect.

**Supplementary Table S3. STR analysis of early- and late- passage bladder cancer urine CRCs**

Samples	STR Alleles															
	D8S1179	D21S11	D7S820	CSF1PO	D3S1358	D5S818	D13S317	D16S539	D2S1338	D19S433	vWA	D12S391	D18S51	Amelogenin	D6S1043	FGA
Patient 1 urine CRC P1	11, 13	29	10, 11	10,12	16	12	8, 9	9, 11	20, 24	13, 15.2	14, 16	15, 19	15	X	13, 20	22
Patient 1 urine CRC P19	11, 13	29	10, 11	10,12	16	12	8, 9	9, 11	20, 24	13, 15.2	14, 16	15, 19	15	X	13, 20	22

The results of DNA fingerprinting of passage 1 and 19 urine CRCs in patient 1 demonstrated that they have 15 identical STR loci and the X-specific Amelogenin locus, thereby verifying their genetic stability.

**Supplementary Table S4. Mutations of hTERT promoter in bladder cancer tissues and CRCs**

<b>hTERT promoter mutation</b>	<b>C124T</b>	<b>C146T</b>
Tumor Tissue	8/12 (66.7 %)	3/12(25.0 %)
Tumor CRCs	7/12 (58.3 %)	2/12 (16.7 %)
Urine CRCs	6/12 (50.0 %)	0/12 (0 %)
Blood	0/12 (0 %)	0/12 (0 %)

Overall distribution of hTERT promoter mutations in urine CRCs, tumor CRCs, tumor tissues and blood cells.

**Supplementary Table S5. The IC<sub>50</sub> and drug sensitivity scores (DSS) of CRCs**

**The IC<sub>50</sub> of CRCs ( μM)**
