

Fig.S1 Schematic diagram of experimental setup and sampling method

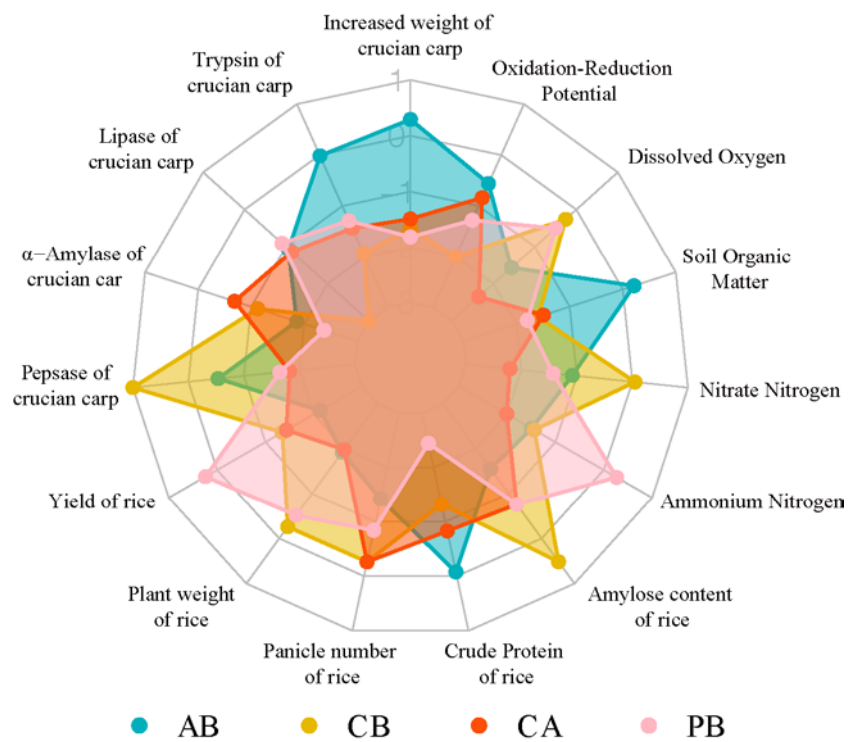

Fig.S2 Display and analysis of multidimensional factors in different bait treatments

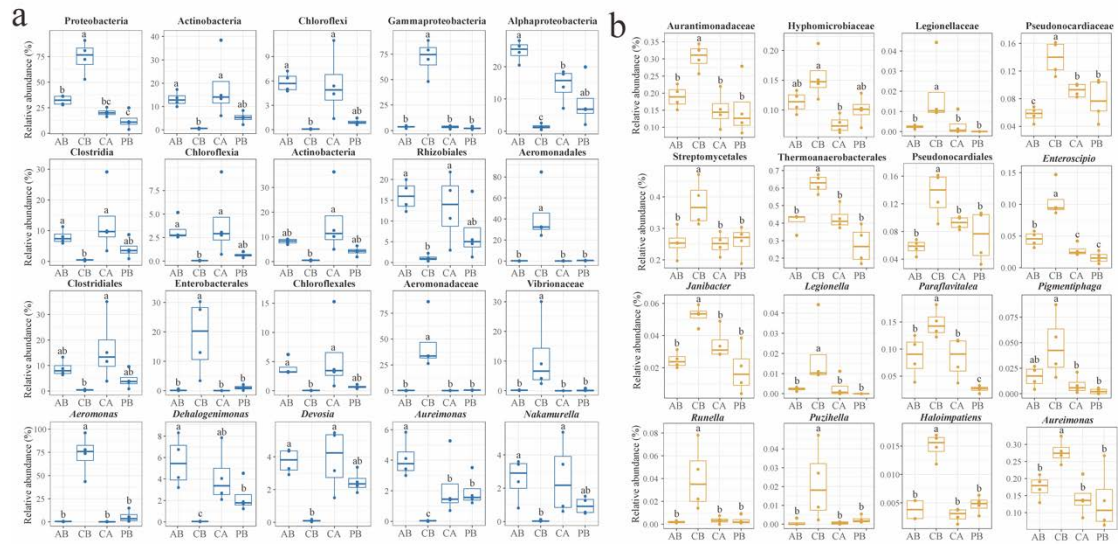

Fig.S3 Analysis of the bacterial community composition and differential taxonomic groups in the gut (a) and soil (b) samples. Differences in different bait treatments at the level of each taxon. For gut samples, only significantly different taxa with relative abundances greater than 1% were visualized. The letters indicate significant differences among baits determined by Mann–Whitney U tests.
